

Problem Statement : Travel Planner Agent

The Challenge

Planning a trip is often stressful and time-consuming. Travelers have to juggle scattered information across dozens of websites to find flights, hotels, and local activities that fit their specific budget and dates. Unexpected weather or sudden cancellations can quickly ruin carefully made plans. Without a single, intelligent assistant to organize, monitor, and adapt these details in real time, travel planning remains a complex and frustrating chore rather than an enjoyable experience.

The Objective

Build an AI-powered Travel Planner Agent that acts as a smart, 24/7 personal travel assistant. The solution should:

- **Personalized Itinerary Building:** Create custom daily travel plans based on user budgets, travel dates, personal interests, and physical constraints.
- **Real-Time Data Retrieval:** Fetch live weather updates, map routes, and local guide information to keep the travel plan accurate and safe.
- **Booking and Logistics Support:** Recommend the best transport options and accommodations, helping users manage their reservations in one place.
